

# Steps to add pre-commit hook to React project:

---

Follow this instruction:

1. Open your React project;
2. Install **husky**:

```
npm install husky --save-dev
```

3. Enable Git hooks

```
npx husky install
```

After this step you should have **.husky** folder in the root of your project

4. Add new scripts to your **package.json**:

```
// package.json
{
  "scripts": {
    // ...
    "test:nowatch": "react-scripts test --watchAll=false",
    "prepare": "husky install",
    "prepublish": "npm run eslint:fix"
  }
}
```

5. Run (to add a command to a hook):

```
npx husky add .husky/pre-commit "npm run prepublish"
```

## Result:

Every time you want to add changes to the repository, **eslint:fix** and **test:nowatch** commands will be run.

If command fails, your commit will be automatically aborted.

You will not be able to commit changes until you fix the error(s).
